Algebraic Specification for RDF Models

Abstract

The following algebraic specification was derived from the RDF Model and Syntax specification (`http://www.w3.org/Press/1999/RDF-REC`). It represents an interpretation of RDF models as algebraic structures. The author is not aware of whether a similar formal representation was published by W3C.

An RDF model is an algebraic structure $\mathfrak{M} = (U; R, L, S, P, \mathrm{Rf}; \overline{K})$ with the following properties:

1. $U = R \cup L, R \cap L = \emptyset$ (resources and literals are disjunct)

2. $\overline{K} = \{$Statement, Seq, Bag, Alt, type, predicate, subject, object, value$\} \cup \mathbb{N}'$ (basic resources)

3. $\mathbb{N}' \subseteq P \subseteq R$ (properties are resources, ordinal numbers are basic properties), where $\mathbb{N}' = \{1, \ldots, n\}$ or $\mathbb{N}' = \emptyset$

4. $S \subseteq P \times R \times (R \cup L)$ (set of statements)

5. $\forall a = (n, s, o) \in S : n \in \mathbb{N}' \wedge n > 1 \Rightarrow \exists o' \in R \cup L : (n - 1, s, o') \in S$ (ordered lists must have no "holes" and begin with 1)

6. $\forall a = (\mathrm{type}, s, o) \in S \Rightarrow o \in R$ (a resource cannot be typed using a literal)

7. $\{$Statement, Seq, Bag, Alt$\} \subseteq R$, $\{$Statement, Seq, Bag, Alt$\} \cap P = \emptyset$ (constants for basic resources)

8. $\{$type, predicate, subject, object, value$\} \subseteq P$ (constants for basic properties)

9. Rf is a partial one-to-one function $\mathrm{Rf} : S \to R$, which associates a statement a with a resource r that reifies that statement. Furthermore, $\mathrm{Rf}(a) = r$ with $a = (p, s, o)$ holds iff:

1

    (a) $(\text{type}, r, \text{Statement}) \in S$

    (b) $(\text{predicate}, r, p) \in S$

    (c) $(\text{subject}, r, s) \in S$

    (d) $(\text{object}, r, o) \in S$

10. $(\text{type}, r, \text{Statement}) \in S \Rightarrow$ there exist exactly one $s \in R, p \in P, o \in R \cup L$ satisfying (a)-(d) above

The specification presented above is a request for comments.
